federal.contractors

Audit packet

Period 2026-09-27 to 2026-09-27

Sample audit packet, built from public entities so anyone can inspect the deliverable. A customer packet covers the account holder's own monitored roster.

`pk_tpnq6rPmArd_S0SY`
`faacefb334b97460ed60577c208e27062ca9f04ec8f2bbe0cd3f488efa6b0bec`

This packet is a sealed index of verification evidence for one period: the monitored entities, every completed check, and the exact source data snapshot behind each check. The complete record enumeration is a compressed, content-addressed attachment whose digest and size are bound by the sealed packet payload. Packet-content claims derive from that sealed payload. Issuer-signature and timestamp metadata in the seal section comes from separate immutable attachments. It is evidence of diligence, not a verdict.

Review summary

2 verification records sealed in this packet · included check dates 2026-09-27.
0 checks matched an exclusion record by UEI
0 checks with potential matches
Counts include repeated checks of the same entity. A potential match is not identity confirmation.

Changes and cadence gaps

No changes or cadence gaps recorded
No detected changes or gaps longer than the stated cadence appear in this packet. Individual exclusion-check outcomes remain separate.

Coverage

This map states what the packet contains for each test area. It does not state how an auditor will judge the evidence.

2 CFR 200.332(a) and 2 CFR 180.300
This packet contains 0 monitored subrecipient entries, 0 dated check records linked to those entries, 0 customer-supplied certification or clause statements, and a per-entity coverage timeline.

2 CFR 200.318(h) with 2 CFR 180.300
This packet contains 1 monitored vendor or subcontractor entry, 2 dated check records linked to those entries, 0 customer-supplied certification or clause statements, and a per-entity coverage timeline.

Compliance Supplement Part 3, section I, Procurement and Suspension and Debarment
This packet contains 1 monitored entity, 2 sealed verification records, 0 detected changes, 1 sealed daily monitoring run, 2 source snapshots, 1 recorded monitoring interval, and 0 recorded monitoring interruptions for the selected period.

It is evidence of diligence, not a verdict.

Monitored entities

Entities whose monitoring period overlaps the packet period, with how each identity was established at import. Dates show when this account monitored each entity, not registration dates.

THE BOEING COMPANY

UEI NU2UC8MX6NK1 · CAGE 08903 · vendor · matched by UEI · monitored 2026-09-27 to period end
2 checks in the period · last 2026-09-27: SAM status Active; registration expiration 2026-11-13; no active exclusion record matched; exact UEI plus registry candidates; exclusion-match-v1
Coverage: first check 2026-09-27 · last check 2026-09-27 · 1 registration re-check · 1-day cadence
Account monitoring: 1 interval in this period; cadence is assessed inside them only.
Monitored from 2026-09-27 06:20:56 UTC (still open at packet generation) · start: added to the roster

Check log summary

Counts, first and last check dates, latest outcomes, and detected changes are shown below. The complete ordered record ids, seals, source facts, and daily-run references are in the compressed, content-addressed record index bound by this packet.

THE BOEING COMPANY (UEI NU2UC8MX6NK1)

2026-09-27 · 1 exclusion check · latest no active exclusion record matched; exact UEI plus registry candidates; exclusion-match-v1
2026-09-27 · 1 registration re-check · latest SAM status Active; registration expiration 2026-11-13; no active exclusion record matched; exact UEI plus registry candidates; exclusion-match-v1

Daily monitoring runs

1 sealed daily run binds the scheduled record digests under dated RFC 9162 roots, and each record in a sealed run carries its own inclusion proof. The complete list is sealed in the packet JSON.

2026-09-27 · mr_mFwbqR5Oyv4YWojv · 1 records · complete
`root 82fabe6926f0356f430b41be9dee705c8f3fee2d332e7a57ad3f947f725e1333`

Methodology

Exclusion checks run against the SAM.gov Exclusions public extract, loaded daily. Registration re-checks use the validated SAM.gov Entity Management daily extract when that day's extract is available, and otherwise complete through a live per-UEI SAM Entity Management API lookup, which is also used when an entity is absent from the public extract. Each re-check record names its own source; a per-UEI API response is one entity's slice, never a full-registry extract. Each format 2 record keeps check time, source as-of time, retrieval time, artifact or endpoint, content hash, and completeness facts distinct. Entity identities are established when monitoring begins by exact UEI, exact CAGE code, or a name match explicitly confirmed by the account holder. Ambiguity is never silently resolved.

A free SAM.gov search is sufficient for compliance with 2 CFR 180.300; this service sells documentation, coverage, and time, not access. We document each check and its contents. We do not determine eligibility, provide legal advice, authenticate issuance or establish independent time through the checksum, or certify a legal outcome. A clear result does not guarantee an entity is reputable, and a listing does not by itself bar an award. Every result in this packet is a

verification with a date, not a claim about the present. It is evidence of diligence, not a verdict.

Source snapshots

The checks in this packet ran against 2 distinct snapshots of government source data, with as-of dates from 2026-09-27 to 2026-09-26. Each snapshot is identified by its SHA-256 content hash and source as-of stamp. Format 2 source entries also record retrieval and completeness separately from check time.

The seal, and how to verify it

The packet id, format version, and seal appear on the cover page. The seal is the SHA-256 hash of the RFC 8785 canonical UTF-8 bytes of the packet payload. To recompute it, download the packet JSON, canonicalize the record field with RFC 8785, compute SHA-256 over those UTF-8 bytes, and compare it to the seal. A mismatch detects changed canonical bytes. A matching checksum alone does not authenticate federal.contractors as issuer or establish independent time. The packet has an attached issuer signature with a DigiCert RFC 3161 timestamp under policy 2.16.840.1.114412.7.1, dated 2026-09-27T18:58:05.000Z. Attachment alone does not mean the signature or timestamp has been validated. When valid, the timestamp establishes that the issuer signature existed no later than the Timestamp Authority's time. It does not prove check execution time, source truth, matching correctness, identity, or a legal outcome. The payload binds the complete verification-record index by immutable filename, SHA-256 digest, byte count, and record count. It also lists the daily monitoring-run roots. The application has no update path for an issued record; corrections and later checks create new records.
